"Master + Slave" system for dimming multiple	15.10	15.11
lighting loads of either single or mixed lamp technologies		
Type 15.10 "Master" - accepts input from a controlling push-button and outputs a dimming signal to a maximum of 32 x 15.11 slave dimmers, or other drivers or luminaires accepting a standardised 0-10 V/1-10 V signal - Use with 4 wire connection - "Soft" On and Off transitions - Linear dimming - Selectable operating modes with or without previous light level memory - Staircase timer function		
 Type 15.11 "Slave" - accepts 1-10 V input from a 15.10 or other 0-10 V/1-10 V output device to dim a wide variety of lamps of different technology Selector switch for incandescent and halogen lighting loads (with or without transformer or electronic driver) Compatible with energy saving dimmable CFL or LED lamps and with all types of electromagnetic transformers Thermal protection against overload, thermofuse for extreme or short-circuit protection Screw terminal * Maximum peak current of the contact 30 A 230 V AC. Use a contactor or power relay to switch loads exceeding this value 	 "Master" dimmer 0-10 V/1-10 V output to drive up to 32 x 15.11 slave dimmers or other similar devices Multi-function (with or without memory, including special "CFL with memory" function) Linear dimming Dimming speed setting Staircase timer function, with switch-off "early warning" signalled by lamps dimming 230 V AC supply, 50/60 Hz with automatic adjustment for frequency 6 A output relay contact* 17.5 mm wide, modular, 25 mm roil mount 	 "Slave" dimmer 1-10 V input, driven by 15.10 or by other 0-10 V/1-10 V output devices Maximum lamp load 400 W 100 W load with energy saving dimmable lamps (LED and CFL) Leading and trailing edge dimming methods "Transformer" function (for use with electromagnetic transformers) Minimum dimming level setting 17.5 mm wide, modular, 35 mm rail mount
For outline drawing see page 11	35 mm rail mount

 $\stackrel{(1)}{\longrightarrow}$ Select "incandescent lamp" (- $\stackrel{(2)}{\longrightarrow}$) position on the front selector. Note

⁽¹⁾ Select "incandescent lamp" () position on the front selector.
⁽²⁾ One transformer only. Power-up only with the lamp load connected.
⁽³⁾ Select "transformer" ()) position on the front selector. Preferably, no more than 2 transformers.
⁽⁴⁾ One transformer only.
⁽⁵⁾ Select "CFL") position on the front selector, and set the appropriate minimum dimming value (dependent on lamp type).
⁽⁶⁾ Only if lamps or electronic transformers are compatible with leading edge method.
⁽⁷⁾ Only if lamps or electronic transformers are compatible with trailing edge method.
⁽⁸⁾ Specific 60 Hz version available (see ordering information).
⁽⁹⁾ It is not recommended to mount more than one dimmer in the same wall box, unless adequate ventilation is provided or the lamp load is less than 100 W (15.51) or 50 W (15.91).
⁽¹⁰⁾ With lamp load > 300 W (> 75 W for CFL or LED lamps), adequate ventilation must be provided - a gap of 9 mm on both side of the dimmer is suggested. Use the plastic separator type 022.09.

I-2017, www.findernet.com

suggested. Use the plastic separator type 022.09. Not compatible with illuminated push-buttons.

Type of load	Selector setting	Regulator setting	
 Incandescent lamps 230 V halogen lamps 12/24 V halogen and LED lamps with electronic transformer/ballast 	(Trailing Edge)	It is suggested to set the "minimum dimming level" at the lowest value, so that the complete dimming range is available. But if it is necessary to avoid too low a level of illumination, a higher value can be set.	
 Dimmable compact fluorescent lamps (CFL) Dimmable LED lamps 	(Leading Edge)	It is suggested to initially set the "minimum dimming level" at an intermediate value and then if necessary, readjust for a level found to be compatible with the lamp being used.	+
12/24 V halogen lamps with toroidal or E-core electromagnetic transformer	(Leading Edge)	It is suggested to set the "minimum dimming level" at the lowest value, so that the complete dimming range is available. But if it is necessary to avoid too low a level of illumination, a higher value can be set.	

Functions - Type 15.51 and 15.91

Operating mode setup

Type 15.51

On 15.51 operating mode 1 or 3 (with memory) is preset, but it is possible to change it using the following sequence:

- a) remove the supply voltage;
- b) press the control button;
- c) apply the supply to the relay, keeping the button closed for 3 second;
- d) on button release, the light will flash twice to indicate the selection of operating mode 2 or 4, or flash once for operating mode 1 or 3.
 Depending the share the selection of the
- Repeating the above steps will alternately change between operating modes.

Type 15.91

- On 15.91 operating mode 4 (without memory) is preset, but it is possible to change it using the following sequence:
- a) remove the supply voltage;
- b) press the control button;
- c) apply the supply to the relay, keeping the button closed for 3 second;d) on button release, the light will flash twice to indicate the selection of operating mode 3, or flash once for operating mode 4.
- Repeating the above steps will alternately change between operating modes.

Thermal protection and signaling

LED (15.81 type only)	Supply voltage	Thermal protection
	OFF	_
	ON	_
	ON	ALARM

Functions - Type 15.81

Dimmers

ALARM

The internal thermal protection (active on all dimmer types) will detect an unsafe temperature, due to overload or incorrect installation, and will turn the dimmer output off. It is possible to turn the dimmer on, by push button, only when the temperature reduces to a safe level (after 1 to 10 minutes, depending on installation conditions) and after removing the cause of the overload.

> Operating mode without memory: at switch-off, the light level is not memorized.

Long control pulse: The light level is progressively raised or lowered in linear way. The lowest value depend on the "minimum dimming level" regulator setting.

Short control pulse: Alternately switches between On and Off between the maximum light level and the off state.

Operating mode with memory: the previous light level is memorized.

Long control pulse: The light level is progressively raised or lowered in linear way. The lowest value dependent on the "minimum dimming level" regulator setting.

Short control pulse: Alternately switches between On and Off. When switching On, the light level assumes the value set during the previous On state.

Leading edge dim	ming	Trailir	ng edge dimming	

Light dimming is realized with "phase cutting technology", which works by "cutting off" part of the mains voltage waveform in order to reduce the RMS voltage fed to the lamp. When the "cut off" part is at the beginning of each half cycle the dimming method is called Leading Edge. When it is towards the end of each half cycle, it is called Trailing Edge. These 2 methods are suitable for dimming different lamp types: Trailing Edge is, in general, more suitable for electronic transformers for low voltage lamps (halogen or LED). Leading Edge is better suited for electromagnetic transformers for LV lamps, 230 V CFL and 230 V LED lamps. Both methods are, however, suitable for dimming 230 V halogen and incandescent lamps.

In consideration of the different lamp types actually available on the market, it is suggested to refer to the technical specification indicated in page 3 and, if given, to the lamp manufacturer's recommendation.

This new system is modular, adaptable to every need and allows control of multiple lamps through a single control device called the "Master Dimmer" Type 15.10.8.230.0010.

The Master Dimmer, produces a 0 - 10 V signal proportional to the dimming value needed: 0 V corresponds to 0% (light off); 5 V equals 50%, 10 V corresponds to the maximum brightness (100% on).

The 0 - 10 V output signal terminals Yout + / Yout of the "Master Dimmer" must be connected to terminals + Yin / Yin of one or more 15.11.8.230.0400, called the "Slave Dimmers", which have the task of changing the voltage applied to the lamps and therefore their brightness.

The result is a flexible system that offers a range of solutions from the minimum configuration of a Master Dimmer and a Slave Dimmer, up to the maximum configuration of a Master Dimmer and 32 Slave Dimmers.

Each slave can drive a different lamp type, depending on the appropriate methodology, "Leading Edge" or "Trailing Edge". It can regulate halogen lamps, dimmable LED lamps, dimmable CFL lamps, electronic transformers, and electromagnetic transformers.

For example, one Master Dimmer can control a Slave Dimmer with LED lamps and at the same time a second Slave Dimmer with halogen lamps, and a third with electronic transformers.

MASTER DIMMER TYPE 15.10 AND SLAVE DIMMER TYPE 15.11

It is recommended that the Master controls from one to a maximum of 32 Slave units.

The push-buttons (including illuminated push-buttons Max. 15) serve as the ON / OFF (momentary push), or when pressed for a longer time they adjust the brightness level.

Each Slave can drive a different load type.

MASTER DIMMER + 0 - 10 V ELECTRONIC TRANSFORMER OR BALLAST

Using only the Master Dimmer it is possible to control electronic transformers or ballasts with a 0 - 10V/1 - 10V input (observing correct polarity). For 1 - 10V applications it is suggested to supply the Ballast Live from terminal 14. This will ensure that the supply to the Ballast is cut-off for a signal < 1 V.

Note: Check that the maximum Peak Current of the Ballast does not exceed the 30 A 230 V AC rating of terminal 14. Use a contactor or power relay to switch loads exceeding this value.

BMS 0 - 10 V OUTPUTS + SLAVE DIMMERS

In the case of Home Automation or Building Automation systems you can use just the Slave Dimmer Type 15.11 directly controlled by the 0 - 10 V output of the building management system (BMS), or by 0 - 10 V rotary regulators.

Wiring diagrams - Types 15.51, 15.81 and 15.91

Note: remember to maintain a ground/earth connection for class 1 light fittings.
